This specification outlines the functional requirements for 2 PCBs, they are:

1. The YUV Logo backlight daughter board
2. The Tray Illumination daughter board

YUV LOGO DAUGHTER BOARD -

You've already completed a decent amount of work here, but there are two main changes that need implementing:

1. A reduction in the number of LEDS used.
    a. I should estimate that 4-6 strategically placed LEDs per letter is sufficient. If it would be possible to keep the number used in total below 14, that would be sufficient for now.
2. Convert of RGB LEDs

TRAY ILLUMINATION DAUGHTER BOARD -

This is a simple board with 3 White LEDs on it. I have attached a mock up from engineering to give you some reference specifications. No I/O header is attached in the model, but you can place it anywhere along the longer edge of the rectangle, on the opposite face to the LEDs.
